PROFESSIONAL SUMMARY

Manual QA graduate with a background in UI/UX design (Figma, Photoshop, Illustrator) and electronic music production. Both disciplines sharpened a precise eye for detail, enabling me to catch visual regressions, identify UX friction, and isolate failure points before they reach production. I built BehemothQA, a Python based QA platform, to turn hours of manual bug discovery into a repeatable, fully documented testing process with AI driven fix suggestions and structured PDF delivery.

FEATURED PROJECT

BehemothQA Python . Automation . AI Powered . Security Testing . NightMOTH

<https://settings-qa-ai.replit.app>

BehemothQA is a full scale QA platform built from scratch in Python. It automates the complete testing lifecycle across UI/UX, security, functional, and load domains. Every run produces a structured report covering 300+ individual checks across 4 severity tiers, with impact predictions and AI driven fix recommendations, exported as a shareable PDF.

Bug Detection

Scans across 31+ test categories, identifying issues in under 60 seconds that would take a manual tester 30 or more minutes per script.

Line Specific Error Analysis

Pinpoints the exact script line triggering each fault, with no manual log diving needed.

Impact Prediction and AI Fixes

Classifies every finding across 4 severity tiers and pairs each bug with a targeted, AI driven remediation recommendation.

DDoS and Load Testing

Simulates up to 50,000 requests and 2,000 concurrent connections, with randomised headers and spoofed IPs for realistic firewall and rate limit validation.

NIGHTMOTH MODE

Security layer exhaustion

6 nightmare modules . WAF fatigue, auth bottlenecks, resource vampires, phantom IP storms

WAF Gut Punch

Padding Evasion

Injects 130 KB of white noise into POST bodies to hit WAF inspection limits and detect Fail Open states.

Resource Vampire

Logic Bomb

Sends 22 levels of deeply nested JSON payloads to trigger non linear CPU and RAM amplification.

SourDoS

TCP Fragment Overlap

Splits the payload across 3 overlapping fragments, lures the WAF with garbage, then delivers the real payload to test firewall reassembly.

Auth Abyss

Token Flood

Floods with 60 unique fake JWT tokens concurrently to measure auth latency drift and IdP bottleneck.

Phantom IP Storm

Carpet Bomb

Rotates 80 spoofed IPs via X-Forwarded-For to test behavioral rate limit bypass.

EBOLA2Shell

BOLA + React2Shell (CVE-2025-55182)

Enumerates adjacent IDs with a spoofed JWT, then feeds them into React Flight prototype pollution payloads targeting RSC endpoints.

SKILLS & TOOLS

Manual QA Graduate

Python 3.x

QA Automation

Manual Testing

Test Case Design

Bug Reporting

Security Testing

Load Testing

NightMOTH

PDF Report Generation
